UX AUDIT

Daraz Pakistan — Mobile Website

A practical review of usability, navigation, product discovery, checkout clarity, accessibility, and trust.

PROJECT TYPE	SCOPE	METHOD
Heuristic UX review	**Mobile web experience**	**Usability principles + task walkthrough**

Prepared as an academic sample
This report demonstrates how to structure a UX audit. Findings are hypotheses based on common e-commerce UX patterns and a task-based review framework; they are not claims from a formal user study or a live technical inspection.

Website: www.daraz.pk

Date prepared: 21 October 2026

1. Executive Summary

Daraz Pakistan is an e-commerce marketplace where people browse products from multiple sellers, compare options, place orders, and track deliveries. This audit focuses on the mobile website because shopping journeys are often completed on small screens and under time pressure.

The main UX objective is to help a shopper move from **finding a suitable product** to **making a confident purchase** with minimal confusion. The review considers five stages: landing, search and filtering, product evaluation, cart, and checkout.

5	6	3	30 days
Journey stages	Potential issues	Priority levels	Suggested review cycle

Key takeaways

• **Make product comparison easier:** keep price, delivery estimate, seller information, ratings, and return information easy to scan.

• **Improve filtering confidence:** show active filters clearly and make it easy to remove or reset them.

• **Reduce checkout uncertainty:** show the order total and any delivery fees before the final confirmation step.

• **Strengthen accessibility:** support readable text, clear focus states, descriptive labels, and adequately sized tap targets.

Overall assessment

The most valuable improvements are likely to be clarity and consistency improvements rather than a full visual redesign. Prioritize issues that could stop a shopper from finding a product, understanding the final cost, or completing an order.

2. Scope & Method

Audit scope

Included: mobile viewport layout, information hierarchy, search and filters, product detail content, cart feedback, checkout cost clarity, error prevention, accessibility basics, and trust cues. Excluded: backend performance testing, analytics review, security testing, and formal accessibility certification.

Evaluation method

Step	What was reviewed	Purpose
1. Define tasks	Find a product, compare options, check delivery/returns, add to cart, and estimate total cost.	Represent common shopper goals.
2. Apply heuristics	Visibility of system status, match with real-world language, consistency, error prevention, recognition over recall, and user control.	Identify friction against established usability principles.
3. Rate severity	Impact on task success, frequency, and ease of recovery.	Prioritize fixes by user impact.
4. Recommend fixes	Specific design changes and success measures.	Turn findings into an actionable plan.

Important limitation: This is a heuristic/sample audit, not a verified usability test. Before presenting findings as confirmed, inspect the current site on an actual phone and validate them with 5–8 representative shoppers.

Representative user tasks

• Find wireless earbuds under a chosen budget and narrow results by rating or delivery.

• Open a product and understand seller reliability, delivery timing, warranty/returns, and total price.

• Add the selected product to the cart and confirm that the cart state updates.

• Proceed toward checkout and identify the complete payable amount before placing an order.

3. Findings & Recommendations

The following are potential UX risks to validate during a live walkthrough. Severity is an initial estimate, not a measured defect count.

Finding	Severity	Potential issue	Recommendation	Measure
F1. Search & filters	**High**	Users may have difficulty understanding which filters are active or resetting them after narrowing results.	Keep selected filters visible as removable chips; provide a clear “Reset filters” action; preserve filters when users return from a product page.	Filter use success; time to find an item
F2. Product comparison	**High**	Product cards can be hard to compare if key information is visually crowded or inconsistently placed.	Use a consistent hierarchy for product name, current price, discount, rating/review count, and delivery cue. Avoid relying on color alone.	Product selection time; comparison errors
F3. Total cost clarity	**High**	Delivery fees, discounts, or other charges may be difficult to understand until later in the journey.	Show a running subtotal in cart and explain delivery charges and discounts before the final order action.	Checkout abandonment; cost-related support queries
F4. Seller & return confidence	**Medium**	Important purchase-risk information may require too much searching across the product page.	Group seller rating, warranty, return eligibility, and delivery estimate into a clearly labeled “Before you buy” section.	Confidence rating; backtracking
F5. Feedback after actions	**Medium**	Users need immediate confirmation after adding an item or applying a filter.	Show a concise confirmation message, update the cart count, and provide a direct “View cart” action without blocking the journey.	Repeated taps; accidental duplicate actions
F6. Accessibility & touch	**Medium**	Small text, low contrast, unclear labels, or compact tap targets can make shopping harder for some users.	Check contrast, text scaling, keyboard focus, accessible names, and tap target size; test with screen reader and zoom.	Accessibility checklist pass rate

4. User Journey Review

Stage	User question	UX risk to check	Design opportunity
Landing	Where should I start?	Promotions may compete with search and category navigation.	Give search and top categories a clear visual priority.
Search/results	Which items match my needs?	Dense results and unclear filters can increase scanning effort.	Improve filter labels, selected states, sorting, and result count.
Product page	Can I trust this item and seller?	Decision-critical details may be spread across multiple sections.	Create a predictable information order and concise delivery/return summary.
Cart	What am I buying and how much?	Item options, quantity changes, and charges must be easy to verify.	Show editable item details, subtotal, discounts, and delivery estimate.
Checkout	What happens if I continue?	Unexpected costs or unclear error messages can reduce confidence.	Show total payable, clear field errors, and a clear final action.

Suggested design principles

Clarity	Use familiar labels and explain fees or restrictions in plain language.
Consistency	Keep similar information in the same place across product pages and checkout.
Feedback	Confirm when the cart changes, a filter is applied, or an action fails.
User control	Make it easy to undo a filter, edit quantity, remove an item, or go back.
Accessibility	Support text resizing, sufficient contrast, readable content, and assistive technology.

5. Prioritized Action Plan

Priority	Action	Effort	Expected benefit
P1	Clarify total payable and delivery charges in cart/checkout.	Medium	Reduces surprises and increases purchase confidence.
P1	Improve filter visibility, selected states, and reset behavior.	Low–Medium	Makes product discovery faster and easier to recover.
P1	Standardize product-card information hierarchy.	Medium	Improves scanning and comparison.
P2	Group seller, delivery, warranty, and returns information.	Medium	Supports trust and informed decisions.
P2	Audit touch targets, contrast, labels, and zoom behavior.	Medium	Improves inclusion and reduces interaction errors.
P3	Run a small usability test and refine based on observed behavior.	Medium	Validates whether the proposed changes solve real problems.

Validation plan

• **Participants:** 5–8 people who shop online at least occasionally, including a mix of experience levels.

• **Tasks:** search for a budget product, compare two options, find return information, add to cart, and report the final payable total.

• **Capture:** task completion, time on task, mis-taps, backtracking, points of confusion, and a 1–5 confidence rating.

• **Success criteria:** most participants complete core tasks without assistance; all can identify total payable before final confirmation; no critical task-blocking issues remain.

Example metrics to track

Metric	How to measure	Why it matters
Task success rate	Completed tasks ÷ attempted tasks	Shows whether users can finish core journeys.
Time on task	Time from task start to correct completion	Highlights avoidable effort.
Error / backtrack count	Wrong taps, repeated actions, or unnecessary returns	Reveals confusing controls or information structure.
Confidence rating	Ask users to rate confidence from 1 to 5	Checks whether purchase-critical information feels clear.

6. Conclusion

A useful UX audit should connect observed friction to user goals and measurable improvements. For Daraz Pakistan's mobile website, the most important areas to validate are product discovery, product-detail clarity, checkout cost transparency, and accessible interaction. The recommended next step is to conduct a short task-based walkthrough on the current live website, record evidence for each issue, and update severity ratings based on actual user impact.

Audit checklist for a live review

- ■ Can a first-time visitor identify search and categories quickly?
- ■ Can users see, edit, and reset active filters?
- ■ Can users compare price, rating, seller, delivery, and returns without excessive scrolling?
- ■ Is the full payable amount clear before the final order action?
- ■ Do actions give clear feedback, and can users recover from errors?
- ■ Can the interface be used with text zoom and assistive technology?
